

FLUKE®

Calibration

5730A High Performance Multifunction Calibrator

Extended specifications

General Specifications

Warm-Up Time..... Twice the time since last warmed up, to a maximum of 30 minutes.

System Installation..... Rack mount kits available.

Standard Interfaces..... IEEE-488, RS-232, USB 2.0 device, Ethernet, 5725A, 52120A, phase lock in (BNC), phase reference out (BNC).

Temperature Performance

Operating 0 °C to 50 °C

Calibration 15 °C to 35 °C

Storage..... -40 °C to 75 °C

Relative Humidity

Operating <80 % to 30 °C, <70 % to 40 °C, <40 % to 50 °C

Storage..... <95 %, non-condensing. A power stabilization period of four days may be required after extended storage at high temperature and humidity.

Safety IEC 61010-1: Overvoltage Category II, Pollution Degree 2

Operating Altitude 2000 m maximum

Guard Isolation 20 V

Electromagnetic Compatibility (EMC)

IEC 61326-1 (Controlled EM environment) IEC 61326-2-1; CISPR 11: Group 1, Class A

Group 1: Equipment has intentionally generated and/or use conductively coupled radio-frequency energy which is necessary for the internal functioning of the equipment itself.

Class A equipment is equipment suitable for use in all establishments other than domestic and those directly connected to a low voltage power supply network which supplies buildings used for domestic purposes.

Emissions which exceed the levels required by CISPR 11 can occur when the equipment is connected to a test object. The equipment may not meet the immunity requirements of 61326-1 when test leads and/or test probes are connected.

USA (FCC) 47 CFR 15 subpart B, this product is considered an exempt device per clause 15.103

Korea (KCC) Class A Equipment (Industrial Broadcasting & Communication Equipment)
This product meets requirements for industrial (Class A) electromagnetic wave equipment and the seller or user should take notice of it. This equipment is intended for use in business environments and not to be used in homes.

Line Power

Line Voltage

5730A 100 V-120 V, 220 V- 240 V ± 10 %

5725A 100 V, 110 V, 115 V, 120 V, 200 V, 220 V, 230 V, 240 V, ± 10 %

Line Frequency 47 Hz-63 Hz

Maximum Power

5730A..... 300 VA

5725A..... 750 VA

Weight

5730A 27 kg (62 lb)

5725A 32 kg (70 lb)

Size

5730A

Height..... 17.8 cm (7 in), standard rack increment, plus 1.5 cm (0.6 in) for feet

Width..... 43.2 cm (17 in), standard rack width

Depth..... 64.8 cm (25.5 in), overall; 59.4 cm (23.4 in), rack depth

5725A

Height..... 13.3 cm (5.25 in)

Width and Depth Both units project 5.1 cm (2 in) from rack front.

Artifact Calibration Standards Requirements

The following external standards are necessary to calibrate the 5730A to the listed specification. Each external standard used must have an uncertainty equal to or less than the listed uncertainty limit.

Fluke Standard	Traceable Quantity	Nominal Value	Uncertainty Limit	5730A Specifications Susceptible to Uncertainty Limit
732B	Voltage	10 V	1.5 ppm	dc volts, ac volts, dc current, ac current
742A-1	Resistance	1 Ω	10 ppm	1 Ω , 1.9 Ω
742A-10k	Resistance	10 k Ω	2 ppm	ac current, dc current 10 Ω to 100 M Ω

Electrical Specifications

The product specifications describe the Absolute Instrumental Uncertainty of the Product. The product specifications include stability, temperature, and humidity; within specified limits, linearity, line and load regulation, and the reference standard measurement uncertainty. The product specifications are provided at a 99 %, k=2.58, normally distributed and a 95 %, k=2, normally distributed level of confidence. Fluke Calibration guarantees product performance to the 99 % level of confidence.

The relative specifications are provided for enhanced accuracy applications. The specifications apply when range constants are adjusted (see "Range Calibration"). To Calculate an enhanced absolute specification from the relative accuracy specification, it is necessary to combine the uncertainty of your external standards with the pertinent relative specifications.

Specifications are valid after allowing a warm-up period of 30 minutes, or twice the time the Product has been turned off. DC Voltage Specifications

Notes:							
Perform the DC Zero calibration every 30 days. In addition, perform the DC Zero calibration after powering up the unit the first time after unpacking following a shipment or if exposed to an environmental change of greater than 5°C .							
1. For radiated EMI fields >400 MHz and <500 MHz, add 1 ppm.

Notes:						
1. Stability specifications are included in the absolute specification values in the primary specification tables.						
2. Temperature coefficient is an adder to accuracy specifications that does <i>not</i> apply unless operating more than $\pm 5^{\circ}\text{C}$ from calibration temperature.						

Minimum Output 0 V for all ranges, except 100 V for 1100 V range

Maximum Load 50 mA for 2.2 V through 220 V ranges; 20 mA for 1100 V range;
50 Ω output impedance on 220 mV range; all ranges <1000 pF,
>25 Ω

Load Regulation <(0.2 ppm of output + 0.1 ppm of range), full load to no load

Line Regulation <0.1 ppm change, $\pm 10\%$ of selected nominal line

Settling Time 3 seconds to full specification; + 1 second for range or polarity
change; + 1 second for 1100 V range

Overshoot<5 %

Common Mode Rejection140 dB, DC to 400 Hz

Remote SensingAvailable 0 V to ± 1100 V, on 2.2 V through 1100 V ranges

Notes:

- Stability specifications are included in the Absolute specification values in the primary specification tables.
- Temperature coefficient is an adder to Absolute specifications that does not apply unless operated more than 5 °C from calibration temperature, or calibrated outside the range 19 °C to 24 °C. Two examples:
- Calibrate at 20 °C: Temperature coefficient adder is not required unless operated below 15 °C or above 25 °C.
- Calibrate at 26 °C: Add 2 °C temperature coefficient adder. Additional temperature coefficient adder is not required unless operated below 21 °C or above 31 °C.
- Refer to current derating factors table for loads outside of this range.
- Active two-wire compensation may be selected for values less than 100 kΩ, with either the front panel or the meter input terminals as reference plane. Active compensation is limited to 11 mA load, and to 2 V burden. Two-wire compensation can be used only with Ω-meters that source continuous (not pulsed) dc current.

Notes:

- For $I < I_L$, errors occur due to thermally generated voltages within the 5730A. Use the following equation to determine the error, and add this error to the corresponding specifications.

$$\text{Error} = K(I_L - I) / (I_L \times I)$$

Where: Error is in mΩ for all two-wire comp values and four-wire short, and in ppm for the remaining four-wire values.
K is the constant from the above table;
I and I_L are expressed in mA for short to 1.9 kΩ;
I and I_L are expressed in μA for 10 kΩ to 100 MΩ
- For $I_U < I < I_{MAX}$ errors occur due to self-heating of the resistors in the calibrator. Use the following equation to determine the error in ppm and add this error to the corresponding specifications.

$$\text{Error in ppm} = K(I^2 - I_U^2)$$

Where: K is the constant from the above table;
I and I_U are expressed in mA for short to 19 kΩ;
I and I_U are expressed in μA for 100 kΩ to 100 MΩ

- Stability specifications are included in the Absolute specification values for the primary specifications.
- Temperature coefficient is an adder to Absolute specifications. It does not apply unless operating more than $\pm 5^{\circ}\text{C}$ from calibration temperature.
- Burden voltage adder is an adder to Absolute specifications that does not apply unless burden voltage is greater than 0.5 V.

- For higher loads, multiply Absolute specification by: $1 + \frac{0.1 \times \text{actual load}}{\text{maximum load for published specification}}$

- The calibrator's compliance limit is 2 V for outputs from 1 A to 2.2 A. 5725A Amplifier may be used in range-lock mode down to 0 A.

Minimum Output 0 for all ranges, including 5725A.

Settling Time 1 second for μA and mA ranges; 3 seconds for 2.2 A range; 6 seconds for 11 range; + 1 second for range or polarity change

Note:

- For output voltages <50 % of full range in the 33 mV, 110 mV, 330 mV, 1.1 V, and 3.5 V ranges, add 0.1 % to the amplitude flatness specification.

Additional Operating Information:

dBm reference = 50 Ω

Range boundaries are at voltage points, dBm levels are approximate.

$\text{dBm} = 10 \log \left(\frac{\text{Power}}{1 \text{ mW}} \right)$; 0.22361 V across 50 Ω = 1 mW or 0 dBm

- Applies to Option 5730A/05 only.

Minimum Output.....300 μV (-57 dBm)

VSWR at Output Terminal.....<1.1 Typical

Frequency Specification±0.01 % of output

Frequency Resolution11,999 counts to 1.1999 MHz, 10799 counts to 11.999 MHz, 3800 counts to 50 MHz

Overload ProtectionA short circuit on the wideband output will not result in damage.
After settling time, normal operation is restored upon removal.

Electromagnetic Compatibility FCC Rules part 15 sub part B

Applies to use in Korea only. Class A Equipment (Industrial Broadcasting & Communication Equipment)

This product meets requirements for industrial (Class A) electromagnetic wave equipment and the seller or user should take notice of it. This equipment is intended for use in business environments and is not to be used in homes.

Indoor use only IP20

52120A Electrical Performance Limits

Voltage compliance developed across inductive loads may prevent range maximum current output being achieved at higher frequencies. The appropriate maximum frequency (F_{max}) for a given load inductance and current is given by:

$$F_{max} = \frac{4.5}{2 \cdot \pi \cdot I \cdot L} \quad \begin{array}{l} I = \text{Current} \\ L = \text{Total inductance} \end{array}$$

The maximum frequency calculated with this equation is only approximate. Series resistance and parallel capacitance also affect the maximum achievable frequency.

Input Common Mode Rejection 80 dB @ DC decreasing linearly to 40 dB at 10 kHz

Input Impedance

Voltage input	> 1 MΩ
Current input	10 Ω

Maximum Output Compliance Voltage 4.5 V rms (6.4 V pk), 6.4 V dc. 120 A range maximum compliance voltage decreases from 4.5 V at 1 kHz to about 3 V at 10 kHz

DC Offset Magnetic remanence that follows abrupt changes in output current level may cause small changes to DC current offset. It is good practice to correct for offsets in DC measurements and techniques such as DC reversal measurement will result in best accuracy.

Operated within 5730A Control Loop (all current ranges)

The current specification of the 52120A, when controlled by a single 5730A, applies to the parallel output of up to three 52120As connected as slaves.

Coverage factor k=2.58 (99 % confidence level)

Notes:

- The inductance and mutual inductance of the 25 turn coil and clamp that is measured causes a frequency dependent compliance voltage across the coil. The length and configuration of the cables that connect the current to the coil also have an effect. Maximum input current is 120 A input at approximately 100 Hz. Maximum current input decreases to approximately 0.8 A at 10 kHz.
- Includes coil/clamp interaction.

Notes:

- The inductance and mutual inductance of the 50 turn coil causes a frequency dependent compliance voltage across the coil. Maximum frequency for 120 A input current is approximately 600 Hz. Maximum current input decreases to approximately 13 A at 10 kHz.
- Includes coil/probe interaction.

Note

The specifications for these coils are at 99 % confidence level and are the combined specification of the coil and a 52120A. If the coils are used with other current sources the calibration specification of the coils alone is 0.65 % (99 % confidence level) from 0 Hz to 10 kHz.
